

30 Video Content Ideas — Google Ads for Local Services + Web Analytics & Conversion Tracking

Positioning: Not "the person who runs ads" or "the person who installs tags", but the person who understands how marketing data, tracking, advertising, leads and business growth connect.

Philosophy: *Measure what matters. Understand what happened. Optimize what drives growth.*

Funnel every post serves: Attention → Awareness → Authority → Trust → Demand

Content Mix (actual distribution across the 30 ideas)

Content Type	Target	Actual	Ideas
Awareness	35%	11 (37%)	1, 2, 3, 8, 12, 14, 16, 18, 19, 23, 27
Education	25%	7 (23%)	7, 13, 17, 20, 21, 22, 26
Evidence / Proof	15%	5 (17%)	5, 9, 10, 24, 25
Problem Diagnosis	15%	4 (13%)	4, 11, 28, 29
Client Acquisition	10%	3 (10%)	6, 15, 30

Case studies: Google Ads: #5, #10 · Tracking: #24, #25 (plus #9 as a data-proof piece).

Evidence rule: No numbers in this plan are real client results. Wherever a figure appears it is **illustrative/hypothetical** and must be labelled as such on screen, or replaced with: **"Use your own client screenshot/data here."** Blur client names, account IDs, phone numbers and customer details in every screenshot.

Master Table

#	Category	Pillar	Target Industries	Audience	Content Type	Hook	Core Problem	Main Insight	Evidence/Visual	CTA	Format
1	A — Google Ads	Profit vs. Platform Metrics	Roofers, Remodeling, Water Damage Restoration	Owners, marketing managers	Awareness	"Your Google Ads can look profitable while your business is actually losing money."	Dashboard shows healthy CPL/conversions; bank account doesn't agree	Google Ads reports <i>leads</i> , not <i>jobs</i> or <i>profit</i> . Without connecting ad data to booked revenue, a "good" CPL can hide a losing campaign	Google Ads conversions column next to a CRM "won jobs" column for the same period (use your own data)	"Compare your Google Ads conversions to closed jobs this month. Do they tell the same story?"	YT 6–8 min · Short 45s · LI 90s
2	A — Google Ads	Location Targeting	Plumbers, Locksmiths, Garage Door, HVAC	Owners, office managers	Awareness	"Why is a guy from 3 states away calling my plumbing company?"	Paying for calls/leads from outside the service area	Google's default location setting can show ads to people <i>interested</i> in your area, not only people <i>in</i> it. One setting quietly leaks budget	Google Ads → Locations → "Where your users were" report + Location options screenshot (Presence vs. Presence or interest)	"Check your location report today. It takes 2 minutes."	YT 5 min · Short 30–45s · LI 60s
3	A — Google Ads	Search Intent	Plumbers, Electricians, HVAC	Owners	Awareness	"You might be paying Google to find people who want to <i>become</i> a plumber — not hire one."	Budget spent on job seekers, DIYers, parts shoppers, "how to" searches	The keyword you bid on isn't the search you pay for. The Search Terms report shows what people actually typed	Search terms report with irrelevant terms highlighted ("plumber salary", "how to fix water heater", "electrician apprenticeship")	"Open your search terms report. Screenshot the weirdest one and send it to your marketing person."	YT 6 min · Short 45s · LI 60–90s
4	A — Google Ads	Lead Quality	HVAC, Roofers, Pest Control	Owners, sales/office managers	Problem Diagnosis	"40 leads. 5 real opportunities. Where did the other 35 come from?"	High lead volume, low qualified-lead rate	Bad leads are a <i>symptom</i> . Causes sit in 7 places: intent, keywords, location, landing page, form friction, tracking, follow-up. Fix the cause, not the volume	Simple "lead autopsy" sheet: 40 leads tagged by reason-not-qualified (hypothetical)	"Tag your last 30 leads by why they didn't book. The pattern tells you what to fix."	YT 8–10 min · Short 60s · LI 90–120s
5	A — Google Ads	Case Study: Lead Volume ≠ Growth	Cleaning, Junk Removal, Landscaping	Owners	Evidence (Case Study)	"Leads went up. Revenue didn't. Here's what the data actually showed."	Agency report celebrated more leads; owner saw no growth	The "conversions" being counted included very short calls and spam forms. Google optimized for <i>more of those</i> . Redefining what counts as a lead changed what Google chased	Before/after: conversion action settings, call-length breakdown, CRM booked jobs (use your own client data)	"If your leads went up and revenue didn't, ask what's being counted as a lead."	YT 8–10 min · Short 60–90s · LI 120s + text post
6	A — Google Ads	Budget Decisions	Roofers, HVAC, Remodeling, Flooring	Owners	Client Acquisition	"Before you increase your Google Ads budget, check these 5 things."	Owners scale spend on a leaky account and amplify waste	More budget multiplies whatever the account already does, good or bad. Diagnose first: search terms, locations, conversion accuracy, lead-to-job rate, follow-up speed	Checklist graphic + 5 quick screen-recorded checks in a (blurred) account	"Save this before your next budget increase. If 2+ fail, your account needs diagnosis, not more budget."	YT 8 min · Short 60s · LI carousel + 90s video
7	A — Google Ads	Smart Bidding Signals	Pest Control, Cleaning, Moving	Owners, marketers	Education	"Google isn't broken. It's doing exactly what you told it to do."	Automated bidding brings junk leads and owners blame "the algorithm"	Smart Bidding learns from the conversions you feed it. Feed it every form fill and it finds form-fillers. Feed it booked jobs and it learns to find buyers	Simple diagram: conversion signal → Google learns → who it finds next. Bidding strategy settings screenshot	"Ask your marketing team: what exactly is Google optimizing for in our account?"	YT 6–8 min · Short 45s · LI 90s

#	Category	Pillar	Target Industries	Audience	Content Type	Hook	Core Problem	Main Insight	Evidence/Visual	CTA	Format
8	A — Google Ads	Lead Quality / Pricing Intent	Junk Removal, Moving, Cleaning	Owners	Awareness	"Your cheapest leads might be your most expensive ones."	Low CPL campaigns full of price shoppers who never book	Cost per <i>lead</i> ignores close rate and job value. A \$25 lead that never books costs more than a \$90 lead that books a \$1,200 job	Hypothetical side-by-side math: CPL vs. cost per booked job vs. revenue per lead (label hypothetical)	"Calculate cost per booked job, not cost per lead. Then decide where the budget goes."	YT 5–6 min · Short 45s · LI 60–90s
9	A — Google Ads	CRM vs. Google Ads	Remodeling, Flooring, Roofers	Owners, marketing managers	Evidence	"Google said Campaign A was our best campaign. The CRM said the opposite."	Budget allocated by platform conversions, not by real customers	Campaign-level CRM comparison often flips the ranking: high-volume campaign → small jobs; low-volume campaign → big jobs	Table: campaign / Google conversions / CRM qualified / won jobs / revenue (use your own client data or label hypothetical)	"Pull your top 3 campaigns. Match them to closed jobs. You might be funding the wrong one."	YT 7–9 min · Short 60s · LI 90s + table image
10	A — Google Ads	Case Study: Ads Worked, Phones Didn't	Water Damage Restoration, Plumbers, Locksmiths	Owners	Evidence (Case Study)	"The ads were working at 11pm. Nobody was answering."	Emergency ads ran 24/7; after-hours calls hit voicemail; owner thought leads were "bad"	Call data showed the issue wasn't ad quality but coverage: missed calls during peak emergency hours. Fix = ad schedule + answering coverage, not new keywords	Call log by hour-of-day heatmap, missed vs. answered (use your own client data)	"Pull your call log by hour. How many calls did you pay for and never answer?"	YT 7–8 min · Short 60s · LI 90–120s
11	A — Google Ads	Lead Drop Diagnosis	HVAC, Garage Door, Electricians	Owners, marketing managers	Problem Diagnosis	"Your leads dropped this month. Don't touch the campaigns yet."	Panic changes made before knowing the cause	Investigate in order: tracking still firing? → budget/limited status → seasonality → impression share/competitors → landing page/site changes → phone/form working. Half the time it's not the ads	Flowchart graphic + Google Ads "Change history" and impression share screenshot	"Save this flowchart for the next time leads drop."	YT 8 min · Short 60s · LI 90s + flowchart image
12	A — Google Ads	Branded Search Inflation	Plumbers, Tree Service, Auto Repair	Owners	Awareness	"You might be paying Google for customers who were already looking for you."	Strong ad results driven largely by people searching the business's own name	Brand searches convert well and make the account look great, hiding weak non-brand performance. Separate brand vs. non-brand to see what ads really <i>create</i>	Search terms report filtered by brand name; campaign split brand vs non-brand (use your own data)	"Ask: how much of our Google Ads result is people who already knew our name?"	YT 6 min · Short 45s · LI 90s
13	A — Google Ads	Landing Page Match	Tree Service, Landscaping, Painters	Owners	Education	"Your ad promised one thing. Your website talks about everything."	Paid traffic sent to homepage; visitors leave without calling	Someone searching "emergency tree removal" wants proof you do <i>that</i> , near <i>them</i> , <i>now</i> . Message match + clear call button beats a pretty homepage	Side-by-side: search term → ad → generic homepage vs. dedicated page (mockup)	"Click your own ad on your phone. Would <i>you</i> call?"	YT 6–7 min · Short 45s · LI 60–90s
14	A — Google Ads	Speed to Lead	Roofers, Remodeling, Painters	Owners, sales teams	Awareness	"You don't have a Google Ads problem. You have a 4-hour callback problem."	Form leads followed up hours/days later; low close rate blamed on ads	Paid leads are often comparing multiple companies. The first to respond frequently wins. Ads can't fix a slow follow-up process	Timeline graphic: lead arrives → competitor calls back → you call back (illustrative); CRM response-time field	"Check the timestamp of your last 10 form leads vs. your first call back."	YT 5 min · Short 30–45s · LI 60s
15	A — Google Ads	Account Diagnosis	HVAC, Plumbers, Electricians	Owners, agency owners	Client Acquisition	"Here's what I actually look at in the first 20 minutes of a Google Ads audit."	Owners don't know what a real audit checks, so they can't judge their account	A real audit starts with <i>measurement</i> (is the data true?), then <i>intent</i> , <i>geography</i> , <i>offer</i> , <i>follow-up</i> . Settings tweaks come last	Screen-recorded walkthrough of an anonymized/demo account	"If you want a second pair of eyes on your account, this is the process I'd use."	YT 10 min · Short 60–90s · LI 120s

#	Category	Pillar	Target Industries	Audience	Content Type	Hook	Core Problem	Main Insight	Evidence/Visual	CTA	Format
16	B — Tracking	Can I Trust My Numbers?	Any local service (examples: HVAC, Roofers, Cleaning)	Owners, marketing managers	Awareness	"Google says you generated 50 leads. Your CRM says 32. Which number do you trust?"	Platform, analytics and CRM numbers never match; owner trusts none	Some gap is normal (attribution, conversion windows, duplicates, spam, offline closes). A <i>large or changing</i> gap is a tracking problem. Know which you have	3-column visual: Google Ads / GA4 / CRM for the same month (use your own data) + "normal vs. problem" checklist	"Compare your three numbers this week. If the gap is bigger than you can explain, investigate."	YT 8 min · Short 60s · LI 90s
17	B — Tracking	Duplicate Conversions	Painters, Cleaning, Landscaping (form-heavy)	Marketers, owners	Education	"One customer filled out one form. Google counted two leads."	Inflated conversions → fake-good CPL → bad budget decisions	Duplicates come from two tags firing for the same action, thank-you page reloads, or the same conversion imported twice. Fix with one source of truth + correct counting settings	GTM Preview showing tag firing twice; Google Ads conversion action list with two "primary" actions for the same lead	"Submit a test form on your site and watch how many conversions show up."	YT 7 min · Short 45–60s · LI 90s
18	B — Tracking	Missing Conversions	Plumbers, HVAC, Electricians (call-heavy)	Owners, office managers	Awareness	"Your sales team says leads are coming in. Google Ads says nothing is happening."	Phone calls from the website or certain forms aren't tracked; bidding gets starved	When Google doesn't see conversions, it assumes the campaign is failing and optimizes away from what's actually working	Comparison: phone log/CRM leads vs. Google Ads conversions (use your own data); GTM Preview showing no tag on form submit	"List every way a customer contacts you. Then check which ones Google can actually see."	YT 7 min · Short 45–60s · LI 90s
19	B — Tracking	Wrong Conversion Goal	Pest Control, Moving, Junk Removal	Owners, marketers	Awareness	"Your tracking may be telling Google to find the wrong customers."	Campaigns optimizing for button clicks, page views or "contact page visits"	Google optimizes <i>exactly</i> for the instruction given. If "conversion" = clicked the phone icon, Google finds clickers, not callers who book	Google Ads → Goals → Conversions list showing "Click to call button" or "Page view" set as primary	"Open your conversions list. What is marked Primary? Is that a real lead?"	YT 6 min · Short 45s · LI 60–90s
20	B — Tracking	Cookies Explained	Any (examples: Remodeling, Auto Repair, HVAC)	Owners, non-technical marketers	Education	"You visited a website yesterday. Today it knows it's you. How?"	Owners don't understand how visits connect to leads, so tracking feels like magic or fraud	A cookie is a small note the website leaves in your browser so it can recognize the same browser later. It connects visit → return visit → lead. Limits: per browser/device, can be blocked, deleted, or shortened	Browser DevTools → Application → Cookies (live demo on your own site); simple "name tag" analogy graphic	"Share this with someone who thinks tracking is either magic or spying."	YT 6–8 min · Short 45–60s · LI 90s
21	B — Tracking	Cookie Lifetime & Attribution	Roofers, Remodeling, Flooring (long decision cycles)	Owners, marketing managers	Education	"A customer clicked your ad, left, came back 3 weeks later and booked. Did your ad get credit?"	Long buying cycles + shortened/deleted cookies + short conversion windows = ads under-credited	Whether that sale is credited depends on the specific cookie, browser rules, consent, device, and the platform's conversion window. No universal "cookie lasts X days" rule. Long-cycle businesses must check theirs	Timeline: ad click → leave → return → convert, with "credited / not credited" branches; Google Ads conversion window setting screenshot	"Ask your team: what's our conversion window, and how long do customers actually take to decide?"	YT 8–10 min · Short 60–90s · LI 120s
22	B — Tracking	Browser vs. Server-Side	Any (examples: HVAC, Water Damage, Remodeling)	Marketers, agency owners, owners	Education	"Why can Google miss a conversion even when the customer actually filled out the form?"	Platforms under-report real leads; optimization weakens	Browser tracking relies on the visitor's browser: ad blockers, privacy settings, slow pages and consent choices can stop it. Server-side measurement sends data from a system you control — more reliable, but still must respect consent	Diagram: browser path vs. server path; GTM server container overview (no client data)	"If your platforms consistently see fewer leads than your CRM, this may be why."	YT 8–10 min · Short 60s · LI 90–120s

#	Category	Pillar	Target Industries	Audience	Content Type	Hook	Core Problem	Main Insight	Evidence/Visual	CTA	Format
23	B — Tracking	Tracking After Website Changes	Any (examples: Painters, Landscaping, Garage Door)	Owners, marketing managers	Awareness	"You redesigned your website. Did your conversion tracking survive?"	New site/form/plugin silently breaks tracking; campaigns degrade for weeks	Tracking is often attached to specific buttons, URLs or form code. Change those and tracking can stop without any error message	Google Ads conversion action status ("No recent conversions"); before/after conversion trend line around launch date (use your own data)	"Launched a new site or form recently? Test-submit it today."	YT 6 min · Short 45s · LI 60–90s
24	B — Tracking	Case Study: The "Lead Drop" That Wasn't	HVAC, Plumbers, Garage Door	Owners	Evidence (Case Study)	"Google Ads said leads dropped sharply. The phones were busier than ever."	After a site update, reported conversions collapsed; Smart Bidding started pulling back	The new form plugin didn't load a thank-you page, so the conversion tag never fired. Google saw "no results" and adjusted bids. Fixing the trigger restored the signal	Tracking event timeline (launch date → conversion drop → fix date); GTM Preview before/after (use your own client data)	"If your results changed the same week your website did, check tracking before the ads."	YT 8–10 min · Short 60–90s · LI 120s + text
25	B — Tracking	Case Study: When Worse Numbers Are Better	Cleaning, Pest Control, Moving	Owners, marketers	Evidence (Case Study)	"We fixed the tracking. The CPL went <i>up</i> . The client was happy. Here's why."	Duplicate/inflated conversions made performance look better than reality	Real CPL is higher than inflated CPL, but it's <i>true</i> , so budget and bidding decisions get better. Accurate bad news beats comfortable fake news	Before/after conversion counts vs. CRM leads; conversion action counting settings (use your own client data)	"If your numbers look too good, check them too."	YT 8 min · Short 60s · LI 120s + text
26	B — Tracking	Attribution	Remodeling, Roofers, HVAC (multi-channel)	Owners, marketing managers	Education	"Google and Facebook both say they got you the same customer. Who's right?"	Multiple platforms claim the same conversion; total "reported" leads exceed real leads	Each platform reports from its own viewpoint and rules. Last click is one view, not the whole story. Use the CRM/first-party source as the referee	Google Ads + Meta Ads Manager + GA4 + CRM totals for the same month, summed vs. actual (use your own data)	"Add up what every platform claims. Compare it to your real lead count."	YT 8 min · Short 60s · LI 90s
27	B — Tracking	First-Party Data	Any (examples: Auto Repair, HVAC, Pest Control — repeat-service businesses)	Owners	Awareness	"If Google Ads disappeared tomorrow, what would you actually know about your customers?"	Business relies on platforms' data instead of its own	First-party data (your leads, jobs, revenue, source) is the asset you own. It feeds better ad optimization (e.g., offline conversion imports) and better decisions	Simple diagram: platform data (rented) vs. your CRM data (owned); CRM lead record with source fields	"Check: does every lead in your CRM have a source and a job value?"	YT 6–7 min · Short 45s · LI 90s
28	B — Tracking	Tracking Health Check	Any (examples: Plumbers, Roofers, Cleaning)	Owners, marketers	Problem Diagnosis	"Is it your marketing or your tracking? Here's a 5-minute test."	Owners can't tell if a performance change is real or a measurement error	Test-submit a form and call → check it appears in Google Ads/GA4 → compare last 7 days CRM vs. platform → check conversion status → check recent site changes	Screen recording: test form submit → GTM Preview → Google Ads conversion diagnostics	"Use this checklist once a month. Takes 5 minutes."	YT 7 min · Short 60s · LI 90s + checklist PDF
29	B — Tracking	GA4 vs. Google Ads Mismatch	Any (examples: HVAC, Remodeling, Electricians)	Marketing managers, owners	Problem Diagnosis	"GA4 says 40 conversions. Google Ads says 55. Neither is lying."	Two Google tools disagree; owner assumes one is broken	Differences come from attribution rules, date reported (click date vs. conversion date), conversion windows, counting settings and consent. Learn which gaps are expected and which signal a break	Side-by-side GA4 key events report vs. Google Ads conversions with the reasons annotated (use your own data)	"Before you call either tool broken, check these 5 differences."	YT 8 min · Short 60s · LI 90–120s

#	Category	Pillar	Target Industries	Audience	Content Type	Hook	Core Problem	Main Insight	Evidence/Visual	CTA	Format
30	B — Tracking	Measurement Stack	Multi-location / scaling service businesses (HVAC, Roofing, Restoration)	Owners, agency owners	Client Acquisition	"5 questions to ask your marketing team about tracking. Their answers tell you everything."	Owners can't evaluate whether their measurement is solid	Ask: What counts as a conversion? Are calls tracked? Do numbers match the CRM? What happens when the site changes? Are booked jobs sent back to Google?	Talking-head with on-screen question cards; optional anonymized "good vs. weak answer" examples	"Share this with your marketing manager. If the answers are unclear, it's worth a review."	YT 8 min · Short 60s · LI 120s

Detailed Briefs (talking points, platform versions, why it matters)

Each brief covers the fields not in the table: **Key Talking Points**, **Platform Adaptation** and **Why This Content Matters**. Hook, problem, insight, evidence, CTA and audience are in the master table.

CATEGORY A — GOOGLE ADS + LOCAL SERVICE BUSINESSES

#1 — "Your Google Ads can look profitable while your business is losing money"

Key talking points 1. Google Ads measures what happens *on the platform*: clicks, calls, forms. It doesn't know which became paid jobs. 2. A roofer with a \$60 CPL can lose money if only 1 in 20 leads books; a \$180 CPL can be great if 1 in 3 books a \$12k job (label: hypothetical math). 3. The metric that matters: cost per booked job, and revenue per ad dollar. 4. You need one bridge: lead source in the CRM + job outcome. 5. Until that bridge exists, "profitable" in Google Ads is an assumption.

Platform adaptation - YouTube (6–8 min): Walk through the full chain: click → lead → estimate → job → revenue. Show where data drops off at each step. -

Shorts/Reels/TikTok (45s): Hook → two hypothetical CPLs on screen → "Which is better?" → reveal close rate flips it. - **LinkedIn (90s)**: Framed for owners and marketing managers: "What your agency report can't tell you."

Why it matters: The core thesis of the brand: platform metrics ≠ business results. Sets up every later post.

#2 — Calls from outside the service area

Key talking points 1. Story opener: a call from someone in a different state asking for service. 2. Location option "Presence or interest" can show ads to people researching your area from elsewhere. 3. Emergency trades (locksmiths, garage door, plumbers) feel this most: every wasted call is a dispatcher's time. 4. Check: Locations → "Where your users were" report, and location options under campaign settings. 5. Also check radius vs. ZIP targeting overlap and excluded areas.

Platform adaptation - YouTube (5 min): Live screen walkthrough of where to find the setting and report. - **Shorts (30–45s)**: Phone ringing → "Hi, I'm in Ohio..." → the one setting. - **LinkedIn (60s)**: "A 2-minute check most local businesses never do."

Why it matters: Instant, verifiable win. Viewers check, find it, and credit you, which builds trust fast.

#3 — Paying for people who want to *become* a plumber

Key talking points 1. Keyword ≠ search term. Broad/phrase match can show you for related searches. 2. Common waste: jobs/salary/training, DIY/how-to, parts/supply, competitor names, free/cheap. 3. Search Terms report = what people actually typed. 4. Negative keywords block the wrong intent. Review regularly, not once. 5. The goal isn't fewer clicks; it's clicks from people with a problem you fix.

Platform adaptation - YouTube (6 min): Read through a real (blurred) search terms report, categorize live. - **Shorts (45s)**: Rapid-fire "you paid for this search" with funny real terms on screen. - **LinkedIn (60–90s)**: "The report that shows what you're really paying for."

Why it matters: Highly shareable, a bit funny, and shows expertise without jargon.

#4 — 40 leads, 5 real opportunities

Key talking points 1. Start with the outcome, not the settings: why didn't 35 leads become opportunities? 2. Tag every bad lead: outside area, wrong service, price shopper, spam, no answer, duplicate. 3. Map tags to causes: intent (keywords), geography (location), expectation (ad/landing page), friction (form), signal (tracking), process (follow-up). 4. The biggest tag bucket tells you where to start. 5. "More leads" fixes nothing if the leak is downstream.

Platform adaptation - YouTube (8–10 min): Full "lead autopsy" method with a template. - **Shorts (60s):** "35 bad leads, 7 possible reasons." Quick list with icons. - **LinkedIn (90–120s):** Diagnostic framework + downloadable tagging sheet.

Why it matters: Gives owners a method, not a tip. Positions you as a diagnostician.

#5 — CASE STUDY: Leads went up, revenue didn't

Story structure - Client situation: Recurring/one-off service business (cleaning / junk removal / landscaping) running Search ads. - **Business problem:** Monthly report showed lead growth; revenue was flat. - **What the data showed:** Conversion actions counted any call (including very short ones) and all form submits, including spam. - **What was actually wrong:** Google was optimizing toward the easiest "conversions", not booked jobs. - **What changed:** Tightened conversion definitions (e.g., minimum call length, spam filtering, qualified-lead import from CRM). - **Business outcome:** Use your own client data here. Do not state a number you can't show. - **Lesson:** What you count is what you get.

Platform adaptation - YouTube (8–10 min): Full story with blurred screenshots. - **Shorts (60–90s):** Problem → twist ("the leads weren't really leads") → lesson. - **LinkedIn (120s + text):** Story post with 3 lessons in the caption.

Why it matters: Proof of thinking, not just doing. Shows you diagnose before you change things.

#6 — Before you increase your Google Ads budget, check these 5 things

Key talking points 1. Search terms: are you paying for the right searches? 2. Locations: are leads coming from where you work? 3. Conversion accuracy: does a Google "conversion" equal a real lead? 4. Lead-to-job rate: do you know it by campaign? 5. Follow-up speed and answer rate: can the team handle more leads?

Platform adaptation - YouTube (8 min): Each check demonstrated in an account. - **Shorts (60s):** Fast checklist, one per 10 seconds. - **LinkedIn:** Carousel PDF + 90s video. Strong save potential.

Why it matters: Natural bridge to service: "If 2+ fail, diagnose first." Helpful, not salesy.

#7 — Google is doing exactly what you told it to do

Key talking points 1. Analogy: hiring a salesperson and paying them per business card collected, not per sale. 2. Smart Bidding learns patterns from the conversions you send. 3. Weak signal (any click/form) → Google finds more of the easiest actions. 4. Strong signal (qualified lead, booked job via offline import) → Google learns what a customer looks like. 5. Before blaming the algorithm, check the instruction.

Platform adaptation - YouTube (6–8 min): Analogy → diagram → where to see bidding strategy and primary conversions. - **Shorts (45s):** Business-card analogy alone carries it. - **LinkedIn (90s):** For marketers: "Signal quality > bid strategy."

Why it matters: Reframes a universal frustration and links Google Ads to tracking, your unique overlap.

#8 — Your cheapest leads might be your most expensive

Key talking points 1. Price-shopper searches ("cheap", "free quote", "near me cost") can produce low-CPL, low-close leads. 2. Show hypothetical math: CPL → close rate → cost per booked job → average job value. 3. Junk removal/moving/cleaning are highly price-compared, so lead quality varies a lot. 4. Sometimes paying more per lead is the profitable move. 5. Judge campaigns by cost per booked job.

Platform adaptation - YouTube (5–6 min): Spreadsheet walkthrough. - **Shorts (45s):** Two numbers on screen, reveal. - **LinkedIn (60–90s):** "The metric your agency should report instead of CPL."

Why it matters: Counter-intuitive, easy to remember, changes how owners judge reports.

#9 — Google said Campaign A was best. The CRM said the opposite.

Key talking points 1. Platform ranks campaigns by conversions; business should rank by revenue. 2. Show campaign table with CRM columns added (label hypothetical if not real). 3. Typical flip: "repairs" campaign = volume; "replacement/full remodel" campaign = revenue. 4. How to build it: source/campaign captured on lead (e.g., UTM/GCLID) → stored in CRM → matched at month end. 5. Budget follows revenue, not volume.

Platform adaptation - YouTube (7–9 min): Build the comparison table step by step. - **Shorts (60s):** Table reveal: "Same account, two stories." - **LinkedIn (90s + image):** Strong for marketing managers.

Why it matters: Visual proof that connecting data changes decisions, which is exactly your offer.

#10 — CASE STUDY: The ads were working at 11pm. Nobody was answering.

Story structure - Client situation: Emergency service (water damage / plumbing / locksmith) running 24/7 ads. - **Business problem:** Owner felt "Google leads are bad"; few jobs from paid calls. - **What the data showed:** Call log by hour showed a concentration of calls outside office hours, many missed. - **What was actually wrong:** Ads ran when nobody answered. The problem was operational, not the targeting. - **What changed:** Ad schedule aligned to answer coverage / after-hours answering service added; bid adjustments by hour. - **Business outcome:** Use your own client data here. - **Lesson:** Look at the whole path, not just the ad.

Platform adaptation - YouTube (7–8 min): Story + heatmap + how to pull your own call log. - **Shorts (60s):** Phone ringing at night visual → "Who answered?" - **LinkedIn (90–120s):** "Marketing problems that aren't marketing problems."

Why it matters: Shows business-level thinking beyond ad settings. Builds trust with owners.

#11 — Your leads dropped. Don't touch the campaigns yet.

Key talking points 1. Step 1: Is tracking still working? (Test-submit, check conversion status.) 2. Step 2: Budget, billing, "limited by budget", disapproved ads. 3. Step 3: Seasonality: compare same period last year (HVAC shoulder seasons). 4. Step 4: Impression share lost to rank/competitors; change history. 5. Step 5: Website, forms, phone lines: any recent changes?

Platform adaptation - YouTube (8 min): Flowchart walk-through with account screens. - **Shorts (60s):** "5 checks before you panic." - **LinkedIn (90s + flowchart):** High save/share potential.

Why it matters: Hits a peak-pain moment. Bookmarked content brings people back when it happens.

#12 — Paying for customers who were already looking for you

Key talking points 1. Brand search = someone typed your company name. 2. Those clicks convert very well, which inflates account averages. 3. Separate brand vs. non-brand to see what ads *generate* vs. *capture*. 4. Brand campaigns can still be worth it (competitors bidding on your name). It's a decision, not a rule. 5. Report them separately so non-brand gets judged honestly.

Platform adaptation - YouTube (6 min): How to split and read the two. - **Shorts (45s):** "Your best campaign might just be your name." - **LinkedIn (90s):** For agency owners/marketers: honest reporting.

Why it matters: Sophisticated insight that makes experienced marketers nod. Builds authority.

#13 — Your ad promised one thing. Your website talks about everything.

Key talking points 1. Search intent is specific; homepages are general. 2. Message match: search term → ad → page headline. 3. Mobile reality: the call button must be immediate. 4. Trust signals near the action: reviews, licensed/insured, service area. 5. Test: click your own ad on your phone.

Platform adaptation - YouTube (6–7 min): Teardown of a (mock/anonymized) page. - **Shorts (45s):** Screen record: search → ad → confusing homepage. - **LinkedIn (60–90s):** "Your landing page is part of your ad."

Why it matters: Practical and visual. Shows you look past the ad platform.

#14 — A 4-hour callback problem

Key talking points 1. Paid search leads often contact several companies. 2. Response time affects who gets the estimate. 3. Check CRM timestamps: lead created vs. first contact. 4. Fixes: instant SMS/auto-reply, routing, call-back SLA. 5. Ads bring the opportunity; process wins it.

Platform adaptation - YouTube (5 min): How to measure your own response time. - **Shorts (30–45s):** Split-screen: you vs. competitor calling back. - **LinkedIn (60s):** Short, punchy, owner-focused.

Why it matters: Relatable instantly. Shows honesty: not every problem is an ads problem.

#15 — The first 20 minutes of a Google Ads audit

Key talking points 1. Minute 0–5: Is the data trustworthy? (Conversions list, primary actions, recent status.) 2. Minute 5–10: Search terms + locations. 3. Minute 10–15: Campaign structure vs. services offered/most profitable. 4. Minute 15–20: Lead outcome: can we see which leads became jobs? 5. What I *don't* touch first: bids, ad copy tweaks.

Platform adaptation - YouTube (10 min): Full screen-share on a demo/anonymized account. - **Shorts (60–90s):** Sped-up audit with on-screen labels. - **LinkedIn (120s):** Professional framing for owners and agency owners.

Why it matters: Demonstrates process transparently. The softest, most credible service CTA.

CATEGORY B — WEB ANALYTICS + CONVERSION TRACKING

#16 — Google says 50. CRM says 32.

Key talking points 1. Every system counts differently; some gap is expected. 2. Normal causes: spam, duplicates the CRM merges, attribution windows, phone leads not logged. 3. Problem signals: gap suddenly changes, gap is huge, platform > CRM consistently with no explanation. 4. Decide your "source of truth" for business decisions (usually CRM). 5. Reconcile monthly: same date range, same definition of lead.

Platform adaptation - YouTube (8 min): Reconciliation walkthrough. - **Shorts (60s):** Hook + "normal vs. problem" two-column graphic. - **LinkedIn (90s):** Marketing-manager-focused.

Why it matters: The flagship tracking hook. Almost every business has seen this mismatch.

#17 — One form, two leads

Key talking points 1. Start with the experience: you get one email notification, Google shows two. 2. Common causes: tag installed twice (site code + GTM), thank-you page reload, two primary conversion actions for the same lead, GA4 import + Google Ads tag both counted. 3. Impact: CPL looks better than reality → budget goes to the wrong places. 4. Then introduce the technical terms: counting setting ("One" vs. "Every" per click), primary vs. secondary actions, deduplication (e.g., transaction/event IDs). 5. Test: submit once, watch GTM Preview and conversions.

Platform adaptation - YouTube (7 min): Live GTM Preview demo on a test site. - **Shorts (45–60s):** "One form → two conversions" animation. - **LinkedIn (90s):** For marketers auditing accounts.

Why it matters: Concrete, demonstrable, and directly tied to money decisions.

#18 — Leads coming in, Google sees nothing

Key talking points 1. List contact paths: call from ad, call from website, form, chat, text, booking widget, email. 2. Often only some are tracked; calls from the website are commonly missed. 3. Missing signals → Smart Bidding thinks a campaign is failing → reduces delivery to what actually works. 4. Fixes: website call tracking (forwarding numbers), form tracking on the real success event, offline imports. 5. Audit: every path → is it tracked → where does it show?

Platform adaptation - YouTube (7 min): Contact-path audit table. - **Shorts (45–60s):** "Google can't optimize what it can't see." - **LinkedIn (90s):** Owner-focused.

Why it matters: Explains "my ads got worse for no reason", a frequent owner complaint.

#19 — Telling Google to find the wrong customers

Key talking points 1. The "Primary" conversion list is the instruction manual for Smart Bidding. 2. Common wrong instructions: click-to-call button clicks, contact page views, "scroll" or "engaged session" events. 3. Button click ≠ call completed ≠ qualified call. 4. Move micro-actions to secondary (observe, don't optimize). 5. Primary = actions closest to revenue.

Platform adaptation - YouTube (6 min): Where to find and change it. - **Shorts (45s):** Hook + one screenshot. - **LinkedIn (60–90s):** "The setting that decides who Google finds for you."

Why it matters: Simple, actionable, often wrong in real accounts. High "check your account" potential.

#20 — Cookies explained without jargon

Key talking points 1. Analogy: a name tag the website hands your browser, which it shows next visit. 2. What it connects: ad click → visit → return visit → form. 3. What it doesn't know: it's the same *browser*, not necessarily the same *person*. Phone vs. laptop = different. 4. Limits: users delete them, browsers restrict them, consent choices affect them. 5. First-party vs. third-party, simply: your own website's note vs. someone else's.

Platform adaptation - YouTube (6–8 min): Live demo in browser DevTools on your own site. - **Shorts (45–60s):** Name-tag analogy with props. - **LinkedIn (90s):** "What every business owner should understand about cookies."

Why it matters: Foundational education; unlocks understanding for #21, #22, #26, #27.

#21 — Cookie lifetime and why your ads may not get credit

Key talking points 1. Scenario: customer sees ad → visits → leaves → returns 3 weeks later directly → books. 2. Whether the ad gets credit depends on: was the identifying cookie still there? Did the browser shorten it? Same device? Consent given? Is the return inside the platform's conversion window? 3. No universal duration: cookie lifetime depends on the specific cookie, platform, browser and configuration. Some browsers limit how long certain cookies persist. 4. Long decision cycles (roofing, remodeling, flooring) are most exposed to under-crediting. 5. What to do: know your typical decision time, check conversion window settings, capture source at lead time and store it in your CRM (first-party).

Platform adaptation - YouTube (8–10 min): Animated timeline with branches. - **Shorts (60–90s):** Story of one customer, two possible endings. - **LinkedIn (120s):** Marketing-manager framing: "Why long-cycle businesses under-credit ads."

Why it matters: Rare topic explained clearly. Strong authority builder for sophisticated viewers.

#22 — Why Google misses conversions that really happened

Key talking points 1. Start: customer submitted the form, you got the email, Google didn't count it. 2. Browser tracking runs in the visitor's browser: ad blockers, privacy features, consent choices, slow loading or leaving the page early can stop it. 3. Server-side measurement: your server/system sends the conversion to the platform, so it's less dependent on the browser. 4. Not a magic fix: consent still applies; setup quality matters; can create duplicates if browser + server aren't deduplicated. 5. Who needs it: businesses where platform-reported conversions are consistently below real leads.

Platform adaptation - YouTube (8–10 min): Diagram-heavy explainer. - **Shorts (60s):** "The browser is the middleman, and it sometimes drops the message." - **LinkedIn (90–120s):** For agency owners and marketers evaluating server-side.

Why it matters: Positions you in the advanced end of the market without scaring non-technical viewers.

#23 — Did your tracking survive the redesign?

Key talking points 1. Tracking often depends on specific URLs, button IDs, or form code. 2. Redesigns, new form plugins, Shopify/WordPress changes, new landing pages can break it. 3. No alarm goes off; numbers just drop, or quietly double. 4. Post-launch checklist: test every form and call path, check GTM Preview, check Google Ads conversion status, compare to CRM for 2 weeks. 5. Best practice: include tracking QA in the launch plan.

Platform adaptation - YouTube (6 min): Post-launch QA checklist walkthrough. - **Shorts (45s):** "New website. Same tracking? Maybe not." - **LinkedIn (60–90s):** Share with web designers/agencies too.

Why it matters: Very common, timely trigger for help. Strong demand driver.

#24 — CASE STUDY: The "lead drop" that wasn't

Story structure - Client situation: Service business (HVAC / plumbing / garage door) launched a refreshed website. - **Business problem:** Google Ads conversions fell sharply within days; campaigns started spending less efficiently. - **What the data showed:** CRM leads and call volume were stable or up. Conversion drop aligned exactly with the launch date. - **What was actually wrong:** New form showed an inline success message instead of a thank-you page; the tag was triggered by the old page URL. - **What changed:** Trigger rebuilt on the actual form success event; tested in GTM Preview; verified in Google Ads. - **Business outcome:** Use your own client data here. - **Lesson:** When results change the same week the website does, check tracking first.

Platform adaptation - YouTube (8–10 min): Full story with event timeline and GTM Preview. - **Shorts (60–90s):** "Ads said leads died. Phones said otherwise." - **LinkedIn (120s + text):** Story post.

Why it matters: Proves tracking is a business issue, not a technical detail.

#25 — CASE STUDY: When worse numbers are better

Story structure - Client situation: Service business with "great" Google Ads CPL. - **Business problem:** Strong reported CPL, but leads in the CRM didn't match the volume. - **What the data showed:** Conversions roughly double CRM leads; one submission triggered multiple counted conversions. - **What was actually wrong:** Duplicate tags + two primary conversion actions for the same lead. - **What changed:** Single source of truth, correct counting, secondary for duplicates. - **Business outcome:** Reported CPL rose to its true level; decisions now based on real data. Use your own client data here. - **Lesson:** Comfortable numbers aren't the goal; accurate ones are.

Platform adaptation - YouTube (8 min): Before/after with explanation. - **Shorts (60s):** "We made the numbers look worse. On purpose." - **LinkedIn (120s + text):** Integrity-focused story; resonates with agency owners.

Why it matters: Builds trust: you prioritize truth over flattering reports.

#26 — Google and Facebook both claim the same customer

Key talking points 1. Example: customer sees a Facebook ad, later Googles you, clicks a search ad, books. 2. Meta may count it (view/click within its window); Google counts it (click). Both "right" by their rules. 3. Sum of platform claims > real customers. 4. Last click is one lens; it under-credits early-stage channels. 5. Referee = your CRM + consistent source capture; compare channels using the same ruler.

Platform adaptation - YouTube (8 min): Customer journey animation + totals comparison. - **Shorts (60s):** "Two platforms, one customer, two invoices of credit." - **LinkedIn (90s):** Budget-allocation framing for marketing managers.

Why it matters: Directly answers "which channel deserves more budget?"

#27 — If Google Ads disappeared tomorrow

Key talking points 1. Platforms hold *their* view of your customers; you rent it. 2. First-party data = leads, jobs, revenue, source captured in your systems. 3. It improves ads too: sending qualified leads/booked jobs back to Google (offline conversion import / enhanced conversions for leads) teaches better targeting. 4. Minimum standard: every

lead has source, campaign, outcome, job value. 5. It's also how you survive privacy changes and platform shifts.

Platform adaptation - YouTube (6–7 min): Rented vs. owned data framework. - **Shorts (45s):** Hook question → "Could you answer?" - **LinkedIn (90s):** Strategic owner framing.

Why it matters: Lifts you from "tag installer" to "measurement strategist".

#28 — Marketing problem or tracking problem? 5-minute test

Key talking points 1. Submit a test form, place a test call. 2. Did it appear in GTM Preview / GA4 realtime / Google Ads (after processing)? 3. Last 7 days: CRM leads vs. platform conversions. 4. Google Ads conversion action status: any "inactive" or "no recent conversions"? 5. Any site/form/phone changes in the last 30 days?

Platform adaptation - YouTube (7 min): Full screen recording of the test. - **Shorts (60s):** Timer on screen, 5 checks. - **LinkedIn (90s + checklist PDF):** Lead magnet friendly.

Why it matters: Practical tool people reuse; brings them back to you monthly.

#29 — GA4 says 40. Google Ads says 55. Neither is lying.

Key talking points 1. Different attribution rules (Google Ads credits ad interactions; GA4 shares credit across channels). 2. Date reported: Google Ads reports by click date by default; GA4 by event date. 3. Conversion windows and counting settings differ. 4. Consent and blocked tags affect each differently. 5. Expected gap vs. alarm: stable gap = normal; sudden change = investigate.

Platform adaptation - YouTube (8 min): Side-by-side report comparison with annotations. - **Shorts (60s):** "Both are right. Here's why." - **LinkedIn (90–120s):** For marketing managers explaining reports upward.

Why it matters: Ends recurring arguments in meetings; shows deep platform knowledge.

#30 — 5 questions to ask your marketing team about tracking

Key talking points 1. What exactly counts as a conversion in our Google Ads account? 2. Are phone calls from the website tracked? 3. How close are platform numbers to our CRM, and why the gap? 4. What's our process when the website changes? 5. Do we send booked jobs/qualified leads back to Google?

Platform adaptation - YouTube (8 min): Each question + what a strong vs. weak answer sounds like. - **Shorts (60s):** Rapid question cards. - **LinkedIn (120s):** Owner/agency-owner framing; highly shareable internally.

Why it matters: Gives owners language to evaluate their team. Clear, non-pushy path to "maybe I need help."

TOP 10 CONTENT TO SHOOT FIRST

Rank	#	Title	Why first
1	16	Google says 50. CRM says 32.	Near-universal pain; the hook does the work; defines the brand's core question "Can I trust my numbers?"
2	1	Ads look profitable, business losing money	Thesis video for the whole channel; owner-level pain; everything else ladders to it
3	6	Before you increase your budget, check these 5 things	Highest save rate; natural, non-pushy demand driver; timely before busy seasons
4	19	Telling Google to find the wrong customers	Viewers can check their account in 60 seconds and often find the issue, which earns instant credibility
5	2	Calls from 3 states away	Funny, relatable, verifiable quick win; great short-form story
6	24	CASE: The "lead drop" that wasn't	Proof story connecting tracking to money; strong authority builder
7	7	Google is doing what you told it	Reframes a universal frustration; bridges Ads + tracking, your unique overlap
8	23	Did your tracking survive the redesign?	Event-triggered demand; strong share-with-web-designer potential
9	3	Paying people who want to become a plumber	Highly visual short-form; shows expertise without jargon
10	21	Cookie lifetime & attribution	Rare, well-explained topic; impresses sophisticated marketers and agency owners

Shoot order logic: Lead with #16 and #1 (thesis), follow with quick-win checks (#19, #2, #3) to earn trust, then proof (#24) and the demand driver (#6).

CONTENT SERIES

1. "Is Your Marketing Lying to You?"

Numbers that look good but mislead. **Ideas:** #1, #12, #16, #25, #29

2. "Before You Increase Your Ad Budget"

Diagnostic checks before spending more. **Ideas:** #6, #8, #9, #4

3. "Where Did the Lead Go?"

Leads lost to tracking gaps, missed calls or slow follow-up. **Ideas:** #10, #14, #18, #22

4. "You Told Google to Do That"

How settings and conversion signals steer the algorithm. **Ideas:** #2, #3, #7, #19, #17

5. "The Website Changed. Did Anything Break?"

Tracking after redesigns, new forms, migrations. **Ideas:** #23, #24, #28, #11

Production Notes

- **Every case study / evidence post:** blur names, account IDs, phone numbers, addresses. Label any illustrative number "hypothetical example" on screen.
- **Short-form structure:** Hook (0–3s) → relatable scenario (3–15s) → insight (15–45s) → one action/CTA.

- **Long-form structure:** Hook → story/scenario → why it happens → how to check (screen share) → what to do → CTA.
- **LinkedIn:** Pair video with a text post that states the lesson in 3–5 short lines; native video, link in comments if any.
- **CTA rotation:** Save / check your account / compare your numbers / share with your marketing manager / use this checklist. Direct service CTAs only on #6, #15, #30 (and softly on case studies).
- **Recurring sign-off:** "Measure what matters. Understand what happened. Optimize what drives growth."
